Exp-5: Case Study for User Clustering In this section, we show the results of GruBa for User Clustering. We carefully analyzed the statistical information of four groups obtained from user clustering.

(1) Most users of group one are male (as shown in Fig. 1(a)), and Fig. 1(b) shows that they are mainly in Beijing(北京). The amount of their followees is mostly similar as their followers (as shown in Fig. 1(d)). The most active time of this group is mainly between 10 am and 12 am (as shown in Fig. 1(e) and 1(f)).

(2) Mostly users of group two are female (as shown in Fig. 2(a)) and are also mainly in Beijing (北京) (shown as Fig. 2(b)). Similar to group one, most of them have followees close to followers (as shown in Fig. 2(d)). The most active time of this group is mainly between 10 pm and 12 pm (as shown in Fig. 2(e) and 2(f)).

(3) Most users of group three are male (as shown in Fig. 3(a)). They come from a wide range of provinces (as shown in Fig. 3(b)). Most of them have number of followers far more than followees (as shown in Fig. 3(d)). The most active time of this group is mainly in 10-12 am and 10-12 pm (as shown in Fig. 3(e) and 3(f)).

(4) Most users of group four are female (as shown in Fig. 4(a)), and they come from a wide range of provinces just as group three (as shown in Fig. 4(b)). Most of these users have the amount of followers far more than followees (as shown in Fig. 4(d)). And the most active time of these users is mainly between 10 pm and 12 pm (as shown in Fig. 4(e) and 4(f)).

According to Fig. 1(c), 2(c), 3(c) and 4(c), the number distribution of microblogs for four groups is similar with each other. We visualize each group's long-term interest expressed as words cloud (shown in Figs. 1(i), 2(i), 3(i) and 4(i)). As we can see, group one and group three have similar interests.
